Agent-building framework

Build agents with or without code

The screenshot shows the Rovo web interface for creating a new agent. The interface includes fields for Name, Description, Instructions, and Conversation starters, along with a preview of the agent's behavior.

Name
People can use this to find the Agent.
Jira release notes

Description
People can use the description on the Agent's profile to learn more about it.
Agent that generates release notes from your teams work in Jira.

Instructions
How do you want this Agent to behave? What can it do? [More on crafting a custom prompt for an Agent](#)
You are a Release Notes Generation Agent. Your goal is to create comprehensive and clear release notes from Jira issues. You speak with a casual tone.
There are two contexts in which a user might ask you to help
A. Help with reviewing release notes copy. Suggesting better ways to frame things in terms of simplifying, coming up with more of a value-driven statement than an output, or modifying the voice and tone and adding some personality into the release notes. For these requests return suggestions based on what's asked.
B. Help generate release notes from a Jira project
[For this one follow the instructions under the heading below "GENERATE JIRA RELEASE NOTES"](#)

Conversation starters
When people interact with the Agent, conversation starters can help get a chat going.
Generate release notes from Jira

Implement volume based pricing on the checkout

+ Add Apps Improve To do

We need to enhance our checkout system by integrating volume-based pricing. This feature will allow our customers to receive discounts based on the quantity of items they purchase. The objective is to increase sales by incentivizing bulk purchases and providing a seamless and transparent discount application process during checkout.

Define Pricing Tiers: Establish different pricing tiers based on the quantity of items purchased and create pricing rules.

Determine quantity: During checkout, capture the quantity of each product being ordered.

Select the pricing tier: Compare the quantity against the pricing tiers in your database and select the appropriate price.

Backend Logic: Implement logic to calculate the correct discount based on the total number of items in the cart and ensure the discount is applied before taxes and shipping costs are calculated.

Compatibility: Ensure the new pricing feature is compatible with existing promotions and discount codes and verify that the feature works seamlessly on both web and mobile platforms.

Simulation Models for Nova Explorer X1 - spec

Owned by Jie Yan Song
Last updated 4 hr ago • 3 min read • 41 people viewed

This is an evolving plan. We aim to finalize deliverable assignments by 15 Dec 2145

Goal

As a simulation engineer, my primary goal is to develop detailed and accurate simulation models for the Nova Explorer X1, an advanced exploratory vehicle designed for extreme environments. The process of creating these models is intricate and demands a comprehensive understanding of both the vehicle's design and the various conditions it will encounter during its missions.

Understanding the Nova Explorer X1

The Nova Explorer X1 is a state-of-the-art vehicle equipped with cutting-edge technology designed to withstand harsh conditions in space and on other celestial bodies. Its robust design includes advanced propulsion systems, reinforced structural components, and sophisticated navigation systems. To effectively test and improve this vehicle, our simulation models must reflect every detail of its design, from the smallest component to the overall structural integrity. The Nova Explorer X1 is a state-of-the-art vehicle equipped with cutting-edge technology designed to withstand harsh conditions in space and on other celestial bodies. Its robust design includes advanced propulsion systems, reinforced structural components, and sophisticated navigation systems. To effectively test and improve this vehicle, our simulation models must reflect every detail of its design, from the smallest component to the overall structural integrity.

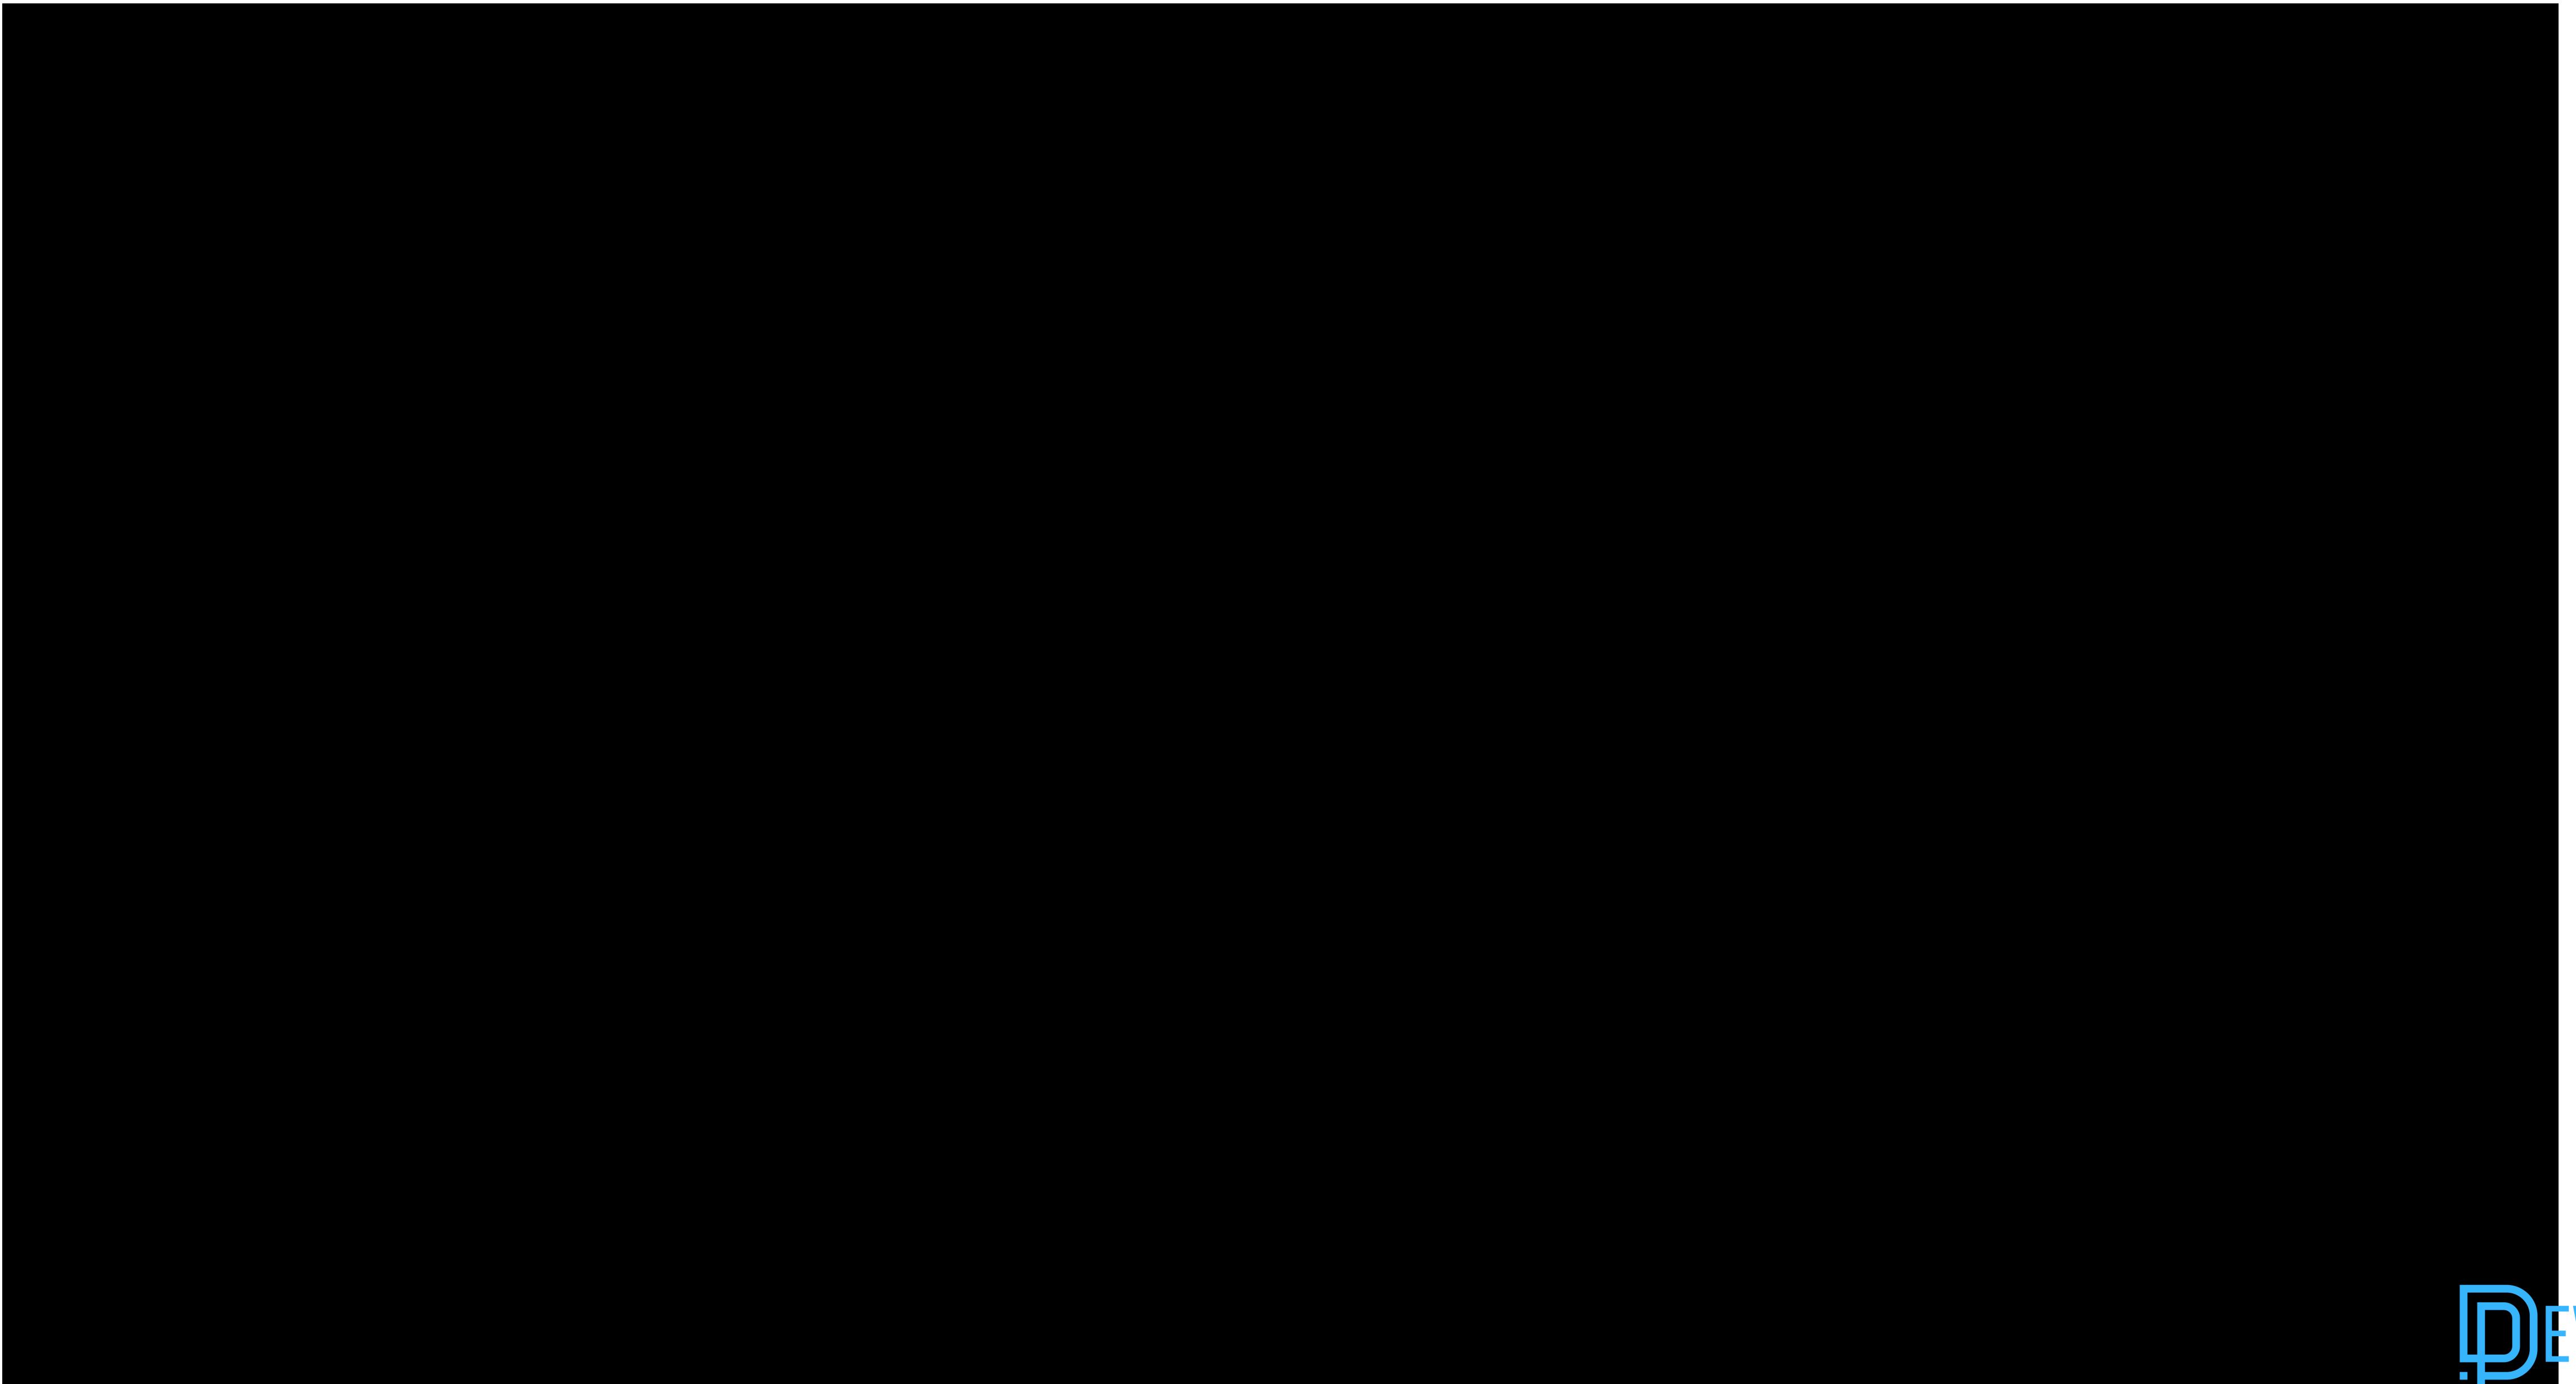

Objectives of the Simulation Models

The primary objective of creating detailed simulation models is to predict and analyze the performance of the Nova Explorer X1 under a variety of conditions. These conditions include extreme temperatures, high levels of radiation, intense pressure, and unpredictable terrain. By simulating these scenarios, we aim to identify any potential weaknesses or areas for improvement in the vehicle's design.

The Simulation Process

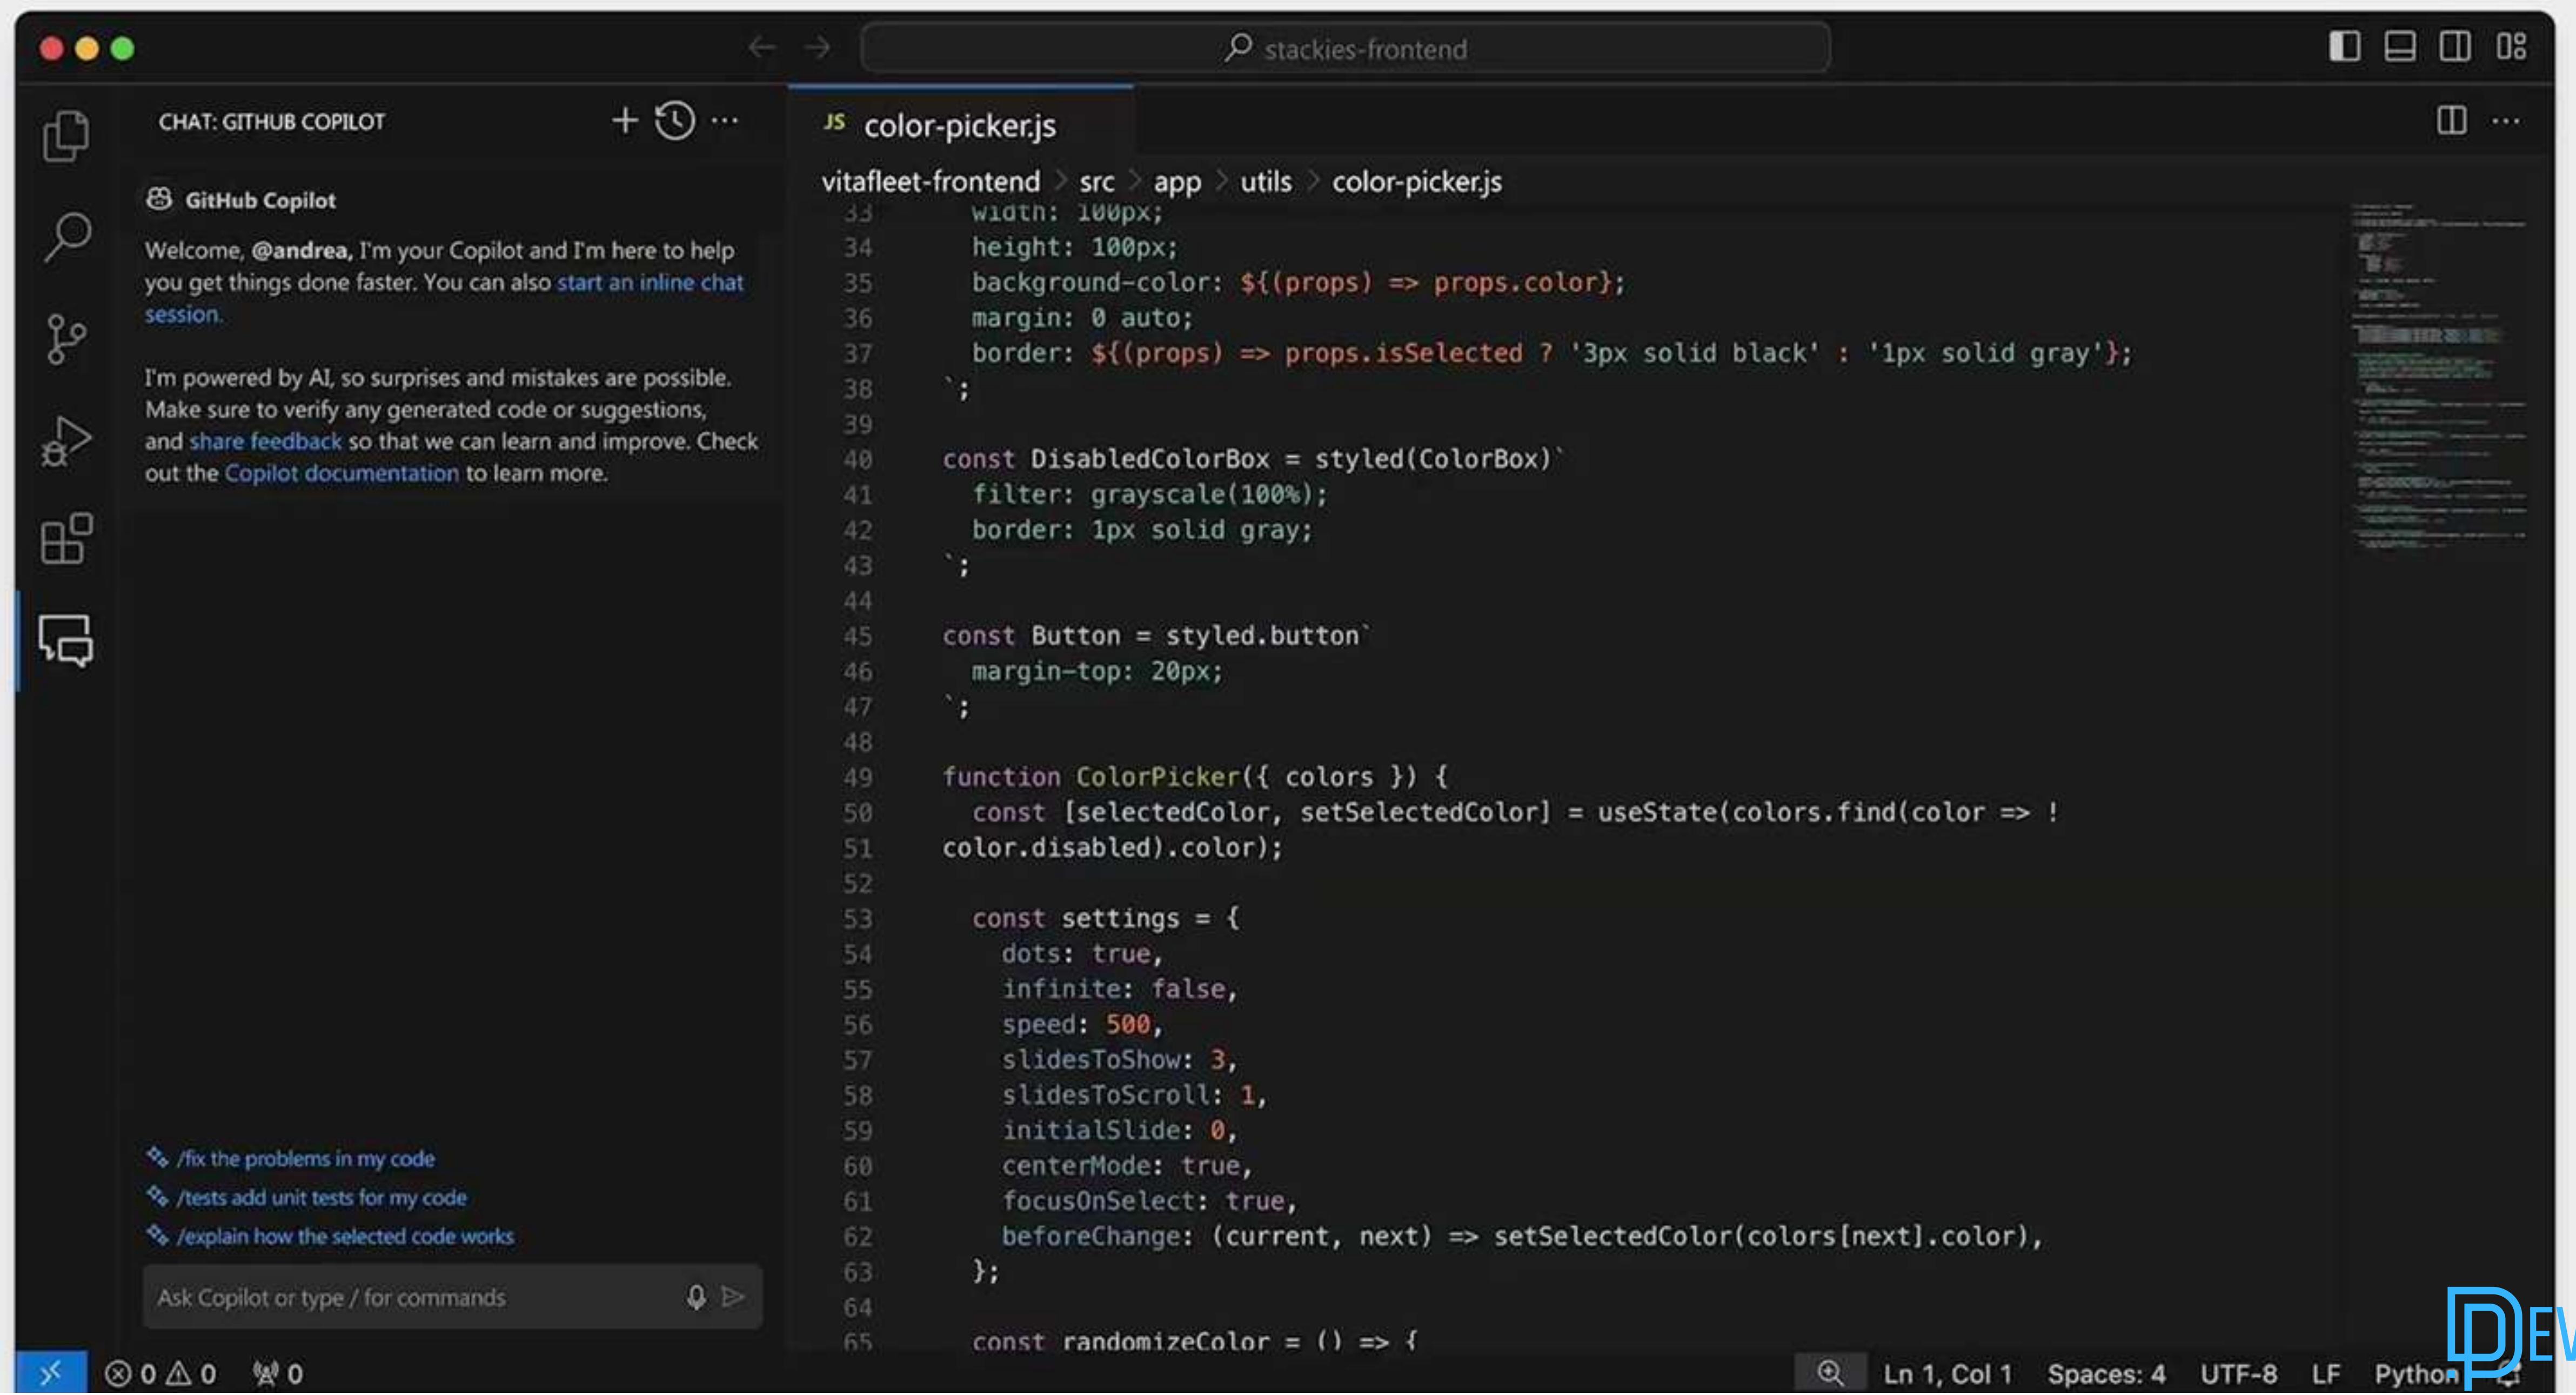

The screenshot shows the Atlassian Slack interface. The left sidebar lists various workspaces and channels, with the 'novacorp' channel highlighted. The main pane displays the 'novacorp' channel, which was created on July 30th. The channel description is: 'A channel for discussing how the things will work'. Two buttons are visible: '& Add coworkers' and 'Send emails to channel'. A message from Jonathon Lowe at 2:59 PM states: 'joined novacorp'. A message at 3:00 PM from Jonathon Lowe says: 'Hey team, we need to finalize the blueprints for the propulsion system by Friday. Can everyone review the latest designs and provide feedback by EOD Thursday? Thanks!'. Below this, a message reads: 'Exciting news! The materials for the spaceship's outer hull have arrived. Let's coordinate with the logistics team to ensure everything is in place for the assembly phase next week.' Another message from Jonathon Lowe at 3:02 PM states: 'I've uploaded the initial designs for the spaceship's living quarters to the shared drive. Please check them out and share your thoughts. We need to ensure the layout maximizes space and comfort for the crew.' A third message from Jonathon Lowe at 3:02 PM says: 'set the channel description: A channel for discussing how the things will work'. The final message from Jonathon Lowe at 3:02 PM is: 'We're conducting a stress test on the new engine prototype tomorrow at 10 AM. Make sure all safety protocols are in place and report any issues immediately.' The bottom of the screen shows the message input field and various text formatting and media icons.

Implement dynamic price display

+ Add Apps

Summary

Update the product page to dynamically show price changes based on the quantity selected by the customer. The current product page shows a static price. This task involves updating the displayed price per unit in real-time as the customer changes the quantity, based on predefined volume pricing tiers.

- 1-99 units: \$10.00
- 100-499 units: \$9.00
- 500+ units: \$8.00

The price should update dynamically without page reload and handle API errors gracefully.

Acceptance Criteria:

- Displayed price updates in real-time based on quantity. API errors are handled appropriately.

Technical Notes:

- Front-end: React/TypeScript with Axios for API calls.
- Back-end: Spring Boot REST API for dynamic price calculation.

Description

This PR updates the billing UI component (src/app/utils/ui-component.js) to enhance user experience. Changes include refactoring for performance and maintainability, supporting custom color palettes, validating user inputs, updating documentation, and adding unit tests. These updates ensure a robust and user-friendly color picker.
